

Make your own hand sanitizer out of Everclear- Ethanol or Ethyl alcohol kills the virus easily. Unfortunately vodka won't work because it's too weak. We need 71%. Vodka is 50% max. But Everclear is usually 91% or 95%. So it can be diluted down to 71% with anything- water, lotion, aloe vera, or my favorite, Aveeno.

So Take the Everclear and make 71 parts. For example add 7.1 cm to a cylinder. Now bring to 91 parts (or 95) which would be 9.1 cm in the cylinder what you want to add. If you add something like glycerin in will hang out on your hands a while. If you pick Aveeno you will have to shake it. In any case, you have what you need to kill the virus when hand washing isn't immediately available.
